

# Protect Pennsylvania's Children

**STOP SCHOOL COVID VACCINE MANDATES. SAFEGUARD EXEMPTIONS.**

## ADVERSE EFFECTS

Vaccines are not tested to determine if they cause cancer,<sup>1</sup> even though they contain known carcinogens.<sup>2</sup>

We cannot know the long-term effects of COVID-19 vaccines on children, because they have not been in widespread use for years.

Healthy males aged 12-17 have an increased risk of developing myocarditis after COVID-19 vaccination.<sup>3</sup> One study found that myocarditis risk for the same age group was higher than risk of hospitalization for COVID-19 infection.<sup>4</sup>

## MINIMAL RISK FROM COVID

Children have negligible risk from COVID-19 with a survival rate of over 99.998% in the U.S.<sup>5</sup>

## NO HERD IMMUNITY

Vaccinated people can still get and transmit the virus that causes COVID.<sup>6</sup> This makes it impossible to attain so-called "herd immunity" through vaccination, even with high vaccination rates.

## SUPPORT:

**HB2013 - Constitutional Amendment Providing Right to Medical Freedom**  
**SB937 - Prohibiting COVID-19 Vaccine Mandates for Children**  
**HB261 - School Vaccination Exemption Announcements**
